SUCTION UNIT

The suction is a carbon brush by-pass motor which is activated by an independent switch placed inside a robust metal motor head. The motor head is soundproofed by sound-absorbent material.

FILTER UNIT

The antistatic PTFE polyester cartridge filter placed inside the filter chamber guarantees a large filter surface and prevents the clogging of the filter. It is possible to clean the filter using the Dustop, an integrated reverse pulse system; by closing the suction inlet and opening a flap in the filter chamber, the airflow generated by the motor cleans the filter thoroughly and safely, maintaining constant suction performance and preventing any dispersion of dust in the environment.

The suction inlet is tangential and the cyclone is entirely welded, consequently slowing the sucked chips and protecting filters.

COLLECTION UNIT

The vacuumed material is collected into a wheeled steel container, which can be extracted for easy disposal and can be used with optional disposable bags, for safer and handier disposal
